

IPA 117

“THE INTIMIDATOR”

- The built-in alarm interface makes it easy to connect to any electronic alarm installation and with on board battery backup, reliable protection is secured.
- The IPA 117 is designed to easily fit into all types of buildings. The outer casing is made of aluminum, and incorporates sabotage protection.
- The IPA 117 can be easily linked with other IPA 117 units in order to protect a larger area; the SmokeCloak products can be used to control the IPA 117.

The IPA117 has been specifically developed to be used to provide intense localized protection in conjunction with SmokeCloak, but can be used as a stand-alone security device. The IPA 117 is an ideal complement to Instant Protection Systems in small or unusually shaped locations with spread out valuable/ high-risk areas.

Unlike conventional sirens that transmit at a steady frequency, the IPA 117 Intimidator covers a frequency spectrum from 2 — 3khz and within that frequency range multiple tones are produced and oscillate in a random pattern. These random frequencies interact with the inner ear that directly affects the offenders balance and sense of wellbeing and enters into the sensory pattern and the longer he stays the worse they will feel.
